Introduction to Project Design

Introduction to Project Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **introduction to project design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to introduction to project design. The output can then be used as an input for the next project activity.

System Architecture

System Architecture

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **system architecture** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to system architecture. The output can then be used as an input for the next project activity.

Module Design

Module Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **module design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to module design. The output can then be used as an input for the next project activity.

User Interface Design

User Interface Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **user interface design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to user interface design. The output can then be used as an input for the next project activity.

Database Design

Database Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **database design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to database design. The output can then be used as an input for the next project activity.

Data Flow Design

Data Flow Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **data flow design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to data flow design. The output can then be used as an input for the next project activity.

Technology Selection

Technology Selection

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **technology selection** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to technology selection. The output can then be used as an input for the next project activity.

Security and Usability Design

Security and Usability Design

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **security and usability design** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to security and usability design. The output can then be used as an input for the next project activity.

Design Review and Improvement

Design Review and Improvement

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **design review and improvement** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to design review and improvement. The output can then be used as an input for the next project activity.

Phase Summary

Phase Summary

Design converts requirements into a structured solution. It describes the system, modules, data, interfaces, technologies, and interactions before detailed development begins.

This page focuses on **phase summary** as part of the project design phase. A project team should approach this activity systematically, record important decisions, and connect each decision to the overall project objective.

Key points

- Define the purpose clearly before starting the activity.
- Identify the people, information, tools, and resources involved.
- Record assumptions and decisions so that the team has a common reference.
- Review the work with team members and make improvements when necessary.

Practical approach

Start with the project objective and then break the work into smaller, understandable actions. Use simple tables, diagrams, checklists, or examples where appropriate. Keep the work realistic for the available time, skills, and resources.

Example

For a student project such as a college event management system, this activity could include defining users such as students and coordinators, identifying the information they need, and deciding how the system will support registration, schedules, notifications, or reports.

Expected outcome

At the end of this activity, the team should have a clear and reviewable output related to phase summary. The output can then be used as an input for the next project activity.
